

Your color. Your process. Your next possibility.

EVERFLON+™

FEP Color Concentrates & Precolored Compounds

Color. With purpose.

FEP color solutions. Designed around your next idea.

A wire that is easier to identify. A tube that belongs to a system. A component with a signature look. Bring color into the engineering conversation with Everflon+™ FEP Color Concentrates and Precolored Compounds. Choose the material format that fits how you make things—and let your product speak for itself.

01 | Two ways to make it yours.

Flexible blending. Or color built in.

FEP Color Concentrates

Pigments dispersed in an FEP carrier, designed for blending with natural FEP resin. A route for manufacturers who want to manage color addition on their own production line.

FEP Precolored Compounds

FEP supplied with color already incorporated at the intended final level. A route that removes the separate concentrate-dosing step from routine production.

Selection point	Color concentrates	Precolored compounds
How color enters production	Blend with natural resin	Process the approved colored formulation
Main appeal	Control over on-line color addition	Simpler material preparation
Key production focus	Accurate dosing and uniform blending	Consistent handling and processing
Starting point	Confirm resin compatibility and let-down ratio	Confirm grade and finished-part requirements

02 | **A little color. A new direction.** Put formulation flexibility in your hands.

For production teams managing different shades, concentrate offers a flexible starting point. Select the base resin, establish the recommended addition rate, and evaluate the result in the actual part.

Everflon+™ offers standard and custom color matching, with melt-flow options for different processing needs.

Start with the resin. Refine the shade. Approve the result.

03 | Color built in. One step simplified.

Bring an approved formulation to the feed stage.

When your priority is a defined color formulation, precolored FEP offers a more direct material workflow. Color is incorporated before delivery, so operators do not need to meter a separate color concentrate during normal processing.

Specify the shade, geometry, and operating requirements together. Then qualify the compound on your equipment before production release.

One formulation. A clearer starting point.

04 | Your shade. Seen in context.

Match the finished part—not just the pellet.

A color reference begins the conversation. The actual component completes it.

For development, define the approved reference, wall thickness, surface finish, and viewing conditions. Evaluate samples in the form your customers will see, with agreed acceptance criteria for repeat orders.

From first impression to approved reference.

05 | **Think beyond the surface.**

Put appearance and engineering in the same brief.

FEP provides a platform valued for chemical resistance, thermal performance, and electrical insulation. A colored formulation must be assessed as a complete material system.

Define what matters for your product: exposure conditions, mechanical behavior, electrical requirements, and appearance. Confirm performance with the selected formulation and finished-part testing.

The right color starts with the right questions.

06 | Make identification part of the design.

Explore color where recognition matters.

Wire & Cable — Every connection, more recognizable.

Explore distinct shades for conductor identification and product differentiation.

Tubing — Give each line a visual identity.

Explore color as part of a tubing identification scheme, alongside labels and system documentation.

Molded Components — Bring the product family together.

Explore coordinated colors across housings, fittings, and other eligible components.

Application concepts require grade selection and validation for the intended use.

What will your next product look like?

Start with a shade. Build a complete material brief.
